

Question#1:

```
#include<stdio.h>
#define teleportation_portals_use 30
#define spaceship_cost 200
#define spaceship_cost_peruse 5
int teleportationcost(int teleportationportals);
int spaceshipcost(int spaceships,int distance );
int totalexpense(int spaceship,int distance,int teleportationportals);

int main (void)
{
int teleportationportals,spaceships,distance;

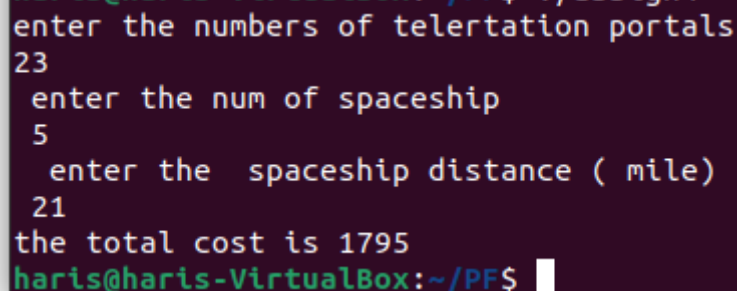

printf("enter the numbers of telertation portals \n");
scanf("%d",&teleportationportals);

printf(" enter the num of spaceship \n ");
scanf ("%d",&spaceships);

printf(" enter the  spaceship distance ( mile) \n ");
scanf ("%d",&distance);
int totalcost=totalexpense( spaceships,distance, teleportationportals);
printf("the total cost is %d\n",totalcost);

return 0;
}

int teleportationcost(int teleportationportals)
{
return teleportation_portals_use * teleportationportals;
}
int spaceshipcost(int spaceships,int distance )
{
return (spaceship_cost * spaceships + spaceship_cost_peruse * distance);
}
int totalexpense(int spaceships,int distance,int teleportationportals)
{
int totalteleportexpense=teleportationcost( teleportationportals);
int spacecost=spaceshipcost(spaceships,distance );
return totalteleportexpense+spacecost;
}
```

```
enter the numbers of telertation portals
23
enter the num of spaceship
5
enter the  spaceship distance ( mile)
21
the total cost is 1795
haris@haris-VirtualBox:~/PF$
```

Question#2:

```
#include<stdio.h>
int formulaOne_car1(int power1,int speed1);
int formulaOne_car2(int power2,int speed2);
int formulaTwo_car1(int efficiency1);
int formulaTwo_car2(int efficiency2);

int main(void)
{
    int power1,speed1,efficiency1,power2,speed2,efficiency2;

    // taking input speed,power,efficiency for car1
    printf("enter the power of the car1\n");
    scanf("%d",&power1);
    printf("enter the speed of the car1\n");
    scanf("%d",&speed1);
    printf("enter the efficiency of the car1\n");
    scanf("%d",&efficiency1);

    int car1_performance=formulaOne_car1( power1, speed1)+formulaTwo_car1( efficiency1); // car1
    performnace
    printf("Car1 performance = %d \n",car1_performance); //display car1 performnace

    // taking input speed,power,efficiency for car2

    printf("enter the power of the car2\n");
    scanf("%d",&power2);
    printf("enter the speed of the car2\n");
    scanf("%d",&speed2);
    printf("enter the efficiency of the car2\n");
    scanf("%d",&efficiency2);
    int car2_performance= formulaOne_car2(power2,speed2) +formulaTwo_car2(efficiency2); //car2
    performance
    printf("Car2 performance = %d \n",car2_performance); // display car2performance

    int engines_overall_performance=car1_performance + car2_performance; // overall
    performance of both cars(optimal power)
    printf("Engines overall performance = %d \n",engines_overall_performance);//display overall
    performance of both cars(optimal power)
    return 0;
}

int formulaOne_car1(int power1,int speed1)
{
    return power1+speed1; //Total power output for car1
}
int formulaOne_car2(int power2,int speed2)
{
    return power2+speed2; //Total power output of car2
}
```

```

int formulaTwo_car1(int efficiency1)           //Engines efficecies at high of car1
{
return efficiency1*efficiency1;
}
int formulaTwo_car2(int efficiency2)           //Engines efficecies at high of car2
{
return efficiency2*efficiency2;
}

```

```

haris@haris-VirtualBox:~/PF$ ./assi
enter the power of the car1
10
enter the speed of the car1
20
enter the efficiency of the car1
40
Car1 performance = 1630
enter the power of the car2
30
enter the speed of the car2
50
enter the efficiency of the car2
60
Car2 performance = 3680
Engines overall performance = 5310
haris@haris-VirtualBox:~/PF$

```

Question#3:

```

#include<stdio.h>
#include<stdbool.h>
float netprofit(float revenue,float expenses);
float profitmargin(float revenue,float expenses);
float ROI(float revenue, float expenses);
float check(float revenue ,float expenses);
int main(void)
{
    float revenue,expenses;
    printf("enter the total revenue for the year \n");
    scanf("%f",&revenue);

    printf("enter the total expenses for year \n");
    scanf("%f",&expenses);
    check(revenue , expenses);

return 0;
}

```

```

float netprofit(float revenue,float expenses)
{
    return revenue-expenses;
}
float profitmargin(float revenue,float expenses)
{
    float x=netprofit( revenue, expenses);
    return x/revenue;
}
float ROI(float revenue, float expenses)
{
    float y= netprofit( revenue, expenses);
    return y/expenses;
}

float check(float revenue ,float expenses)
{
    if (revenue<=0 || expenses<=0 )
    {
        printf("!!!____ERROR\n");
        return -1;
    }
    else
    {
        printf("the net profit is %.2f%\n",netprofit( revenue, expenses));
        printf("the profit margin is %.2f%\n", profitmargin( revenue, expenses));
        printf("the ROI is %.2fn%", ROI(revenue,expenses));
    }
    return 1;
}
}

```

```

enter the total revenue for the year
23004
enter the total expenses for year
1243
the net profit is 21761.00%
the profit margin is 0.95%
the ROI is 17.51
haris@haris-VirtualBox:~/PF$ ./assign3
enter the total revenue for the year
23
enter the total expenses for year
0
!!!____ERROR
haris@haris-VirtualBox:~/PF$

```

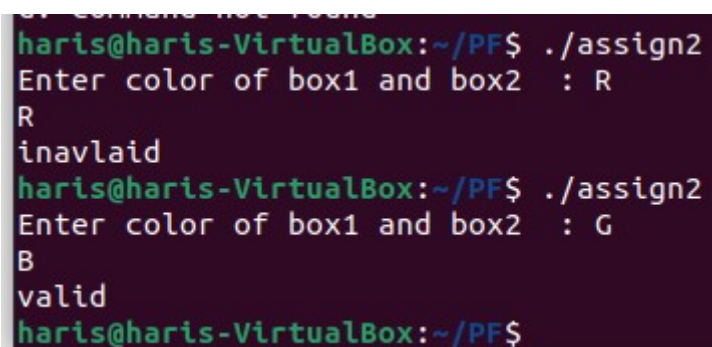

Question#4:

```
#include <stdio.h>
#include<stdbool.h>
char boxCheck(char box1,char box2);
